Art Unit: 1791

DETAILED ACTION

Response to Amendment

1. The amendment filed February 25, 2009 has been entered. Claims 26, 34, 39, 41 and 45-46 are amended; claims 1-25 were previously canceled; claims 48-68 were previously withdrawn. Claims 26-47 are under examination.

Claim Rejections - 35 USC § 112

- 2. The following is a quotation of the second paragraph of 35 U.S.C. 112:
 - The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.
- Claims 26-47 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.
- 4. The term "very low friction surfaces and anti-fouling properties" in claim 26 is a relative term which renders the claim indefinite. The term "very low" is not defined by the claim, the specification does not provide a standard for ascertaining the requisite degree, and one of ordinary skill in the art would not be reasonably apprised of the scope of the invention. Appropriate correction is required.

Claim Rejections - 35 USC § 103

- 5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and

Art Unit: 1791

the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

- 6. Claims 26-29, 31-32 and 36-47 are rejected under 35 U.S.C. 103(a) as being unpatentable over Frost *et al.* (WO 98/58788) in view of Proos *et al.* (US 5,335,935) and the APA (admitted prior art; paragraph references to US 2007/0023959).
- Regarding **claim 26**, Frost *et al.* discloses a method of molding an article for underwater use (page 4, lines 20-24) having a relatively small thickness in relation to its dimension in plan (page 2, lines 18-20). The method includes providing a mold for the article (page 2, line 21), locating or forming one or more inserts on a mold face which defines a part of the surface of the molded article (page 2, lines 22-24), introducing a material to be molded into the mold (page 2, lines 25-26), the material having very low friction surfaces and anti-fouling properties (page 4, line 20 page 5, line 7), maintaining the mold in an orientation while the material hardens such that the mold face is inclined to the horizontal at an angle at which the insert is retained on the face against slipping by friction during the hardening of the material (page 2, line 27 page 3, line 3), and providing gas-outlet means from an upper part of the mold in the orientation to allow the escape of gasses during the molding process (page 3, lines 4-6).
- Frost *et al.* fails to disclose providing attachment means with an irregular surface in contact with the material. However, Proos *et al.* discloses a method for molding an article having a relatively small thickness in relation to its dimension in plan (abstract), wherein a material is injected into the mold to form a backing layer bonded to the material (abstract), and providing attachment means with an irregular

Art Unit: 1791

surface in contact with the material (col. 3, lines 19-21). As taught by Proos *et al.*, providing such attachment means as a roughened layer prior to molding produces "...projections which are securely embedded within the resinous backing layer during molding such that the leather layer and the resinous backing layer are strongly bonded to one another." (col. 3, lines 21-25). Thus, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified the method of Frost *et al.* with the attachment means of Proos *et al.* to securely embed the material to the attachment means such that they are strongly bonded to one another, as taught by Proos *et al.*

- Frost *et al.* is silent as to the material being silicone. However, the APA discloses silicone material for use in the molding of underwater signs with anti-fouling properties and very low friction surfaces to be well known in the art. Specifically, the APA states that, "[s]uch plastics are known in the art <u>and do not form part of the present invention</u>" (¶¶14-15; emphasis added). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have selected silicone to produce an underwater sign because such material was well known for its anti-fouling and low friction surface properties, as admitted in Applicant's own specification (¶14).
- Regarding claims 27-28, Proos et al. discloses the attachment means being a flexible sheet (col. 3, lines 19-26).

Application/Control Number: 10/576,846

Art Unit: 1791

Regarding claims 29, and 31-32, Proos et al. discloses the attachment means being mechanically roughened to form short bristles (col. 10, lines 64-66) and ribbed (claim 8).

Page 5

- Regarding claims 36-38, Proos et al. discloses the attachment means being impermeable polyvinylchloride (col. 9, lines 60-65).
- Regarding claim 39, Frost et al. discloses during the introduction of the material to
 be molded, the mold is supported in an orientation in which the mold face is
 substantially horizontal and, after the introduction, is moved to an inclined orientation
 at an angle at which the insert is retained on the mold face against slipping by
 friction, for the article to harden (claim 2).
- Regarding claims 40-41, Frost et al. discloses the insert being retained in the
 finished article (claim 3), and in which the insert is a partially-cured molded article
 which hardens and bonds to the molding material as the molding material hardens
 (claim 4).
- Regarding claim 42, Frost et al. discloses a plurality of the inserts being molded in a single mold body so shaped that the inserts have a predetermined spacing and orientation, which is maintained as the inserts are transferred to their position on the mold face (claim 5).
- Regarding claim 43, Frost et al. discloses the insert to be retained is molded directly
 on the mold face by means of subsidiary mold means which are removed when the
 insert has cured sufficiently to be at least substantially cohesive (claim 6).

Art Unit: 1791

- Regarding claim 44, Frost et al. discloses the subsidiary mold means including a
 template having cut-out portions defining the insert, and material for forming the
 insert being applied to the apertures in the template (claim 7).
- Regarding claim 45, Frost et al. discloses the template being placed in contact with
 the mold face and the material for forming the insert applied thereto by spatula and
 scraped off level with the surface of the template (claim 8).
- Regarding claim 46, Frost et al. discloses a transfer sheet being applied to a partly
 cured insert to maintain the component parts thereof in a predetermined relative
 orientation and spacing upon transfer from the mold body to the mold face (claim 9).
- Regarding claim 47, Frost et al. discloses the template being cut by a cutter
 controlled by computer means which is programmable to determine the shape of the
 cut-out portions to be changed to form different inserts (claim 10).
- 7. **Claim 30** is rejected under 35 U.S.C. 103(a) as being unpatentable over Frost *et al.* (WO 98/58788) in view of Proos *et al.* (US 5,335,935) and the APA, as applied to claim 26 above, further in view of Amano (US 4,963,413).
- Frost et al. in view of Proos et al. fails to disclose chemically the surface of the attachment means. However, Amano discloses chemically etching an insert in a mold prior to injecting a material onto it (abstract; claim 3). As taught by Amano, chemically etching the insert chemically activates it so that the insert and material "...are firmly adhered to each other." (col. 4, lines 39-48). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to

Application/Control Number: 10/576,846

Art Unit: 1791

have modified the method of Frost *et al*. with the chemical etching step of Amano to chemically activate and firmly adhere the material to the insert, as taught by Amano.

Page 7

- 8. Claims 33-35 are rejected under 35 U.S.C. 103(a) as being unpatentable over Frost et al. (WO 98/58788) in view of Proos et al. (US 5,335,935) and the APA, as applied to claim 26 above, further in view of Billarant (US 4,617,214).
- Frost *et al.* in view of Proos *et al.* fails to disclose the attachment means being knit loops, Velcro-like or velour. However, Billarant discloses molding an article with an insert having attachment means which include loops, velour and are Velcro-like (abstract; fig. 1; col. 1, line 65 col. 2, line 2). As taught by Billarant, attachments having these shapes "...firmly bond to the molding material during the molding operation." (col. 1, lines 20-23). Thus, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified the method of Frost *et al.* with the attachment shapes of Billarant to firmly bond the molding material to the attachment means, as taught by Billarant.

Response to Arguments

- 9. Applicant's arguments with respect to claims 26-47 have been considered but are moot in view of the new ground(s) of rejection. To the extent the arguments are applicable to new grounds of rejection they are addressed below.
- Applicant first argues that the molded article of Frost et al. is not intended for underwater use. Applicant's arguments do not appear to consider the teaching of

Application/Control Number: 10/576,846

Art Unit: 1791

Frost *et al* at page 4, lines 20-25. Frost *et al*. discloses the following: "[t]he preferred use of the invention ... is in the moulding of <u>underwater signs</u> for which special plastics material with anti-fouling properties are required. Such plastics are known in the art." (emphasis added; page 4, lines 20-25). Thus, the molded article of Frost *et al*. is specifically intended for underwater use.

Page 8

- Applicant further argues that "...the Proos patent is directed to an entirely different field" because the patent deals with vehicle airbag molding rather than underwater materials. This argument has been considered but is not persuasive. A person of ordinary skill is presumed to have the ability to select and utilize knowledge from other arts that are reasonably pertinent. *In re Antle*, 444 F.2d 1168, 1171-72, 58 CCPA 1382, 170 USPQ 285, 287-88 (CCPA 1971). Such is the case here. Both references are directed to the molding of plastics, and a person of ordinary skill in the art would certainly have the ability to consider both references together at the time the invention was made, particularly in light of Proos' teachings that other materials and "...molded parts for applications other than vehicles can be produced using the method" (col. 13, line 62 col. 14, line 2).
- Applicant finally argues that Proos discloses an opposite arrangement of method steps and thereby renders the combination inoperable. This argument has been considered but is not persuasive for two reasons. First, the method as claimed requires no particular order with regard to the steps of introducing the material into the mold or providing attachment means with an irregular surface. Second, Proos is cited as teaching that attachment means such as a roughened layer produces

Art Unit: 1791

projections which are securely embedded within the resinous backing layer during molding such that the leather layer and the resinous backing layer are strongly bonded to one another. The order in which the material or attachment means are introduced into the mold is irrelevant and does not, as Applicant asserts, render either Frost *et al.* or Proos inoperable.

Conclusion

10. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to LARRY THROWER whose telephone number is 571-
